r's Ramblings:

up!

Okay, let's choose how to manage screen sizes:

```
info = pygame.display.Info()
w = info.current_w
h =  "      _h
```

getting screen info
/need pygame init before ...

```
font = pygame.font.SysFont("monospace", n)
print(font.size("%"))
```

to be determined by ...

character of which we want the dims.

OUTPUT: (w, h)

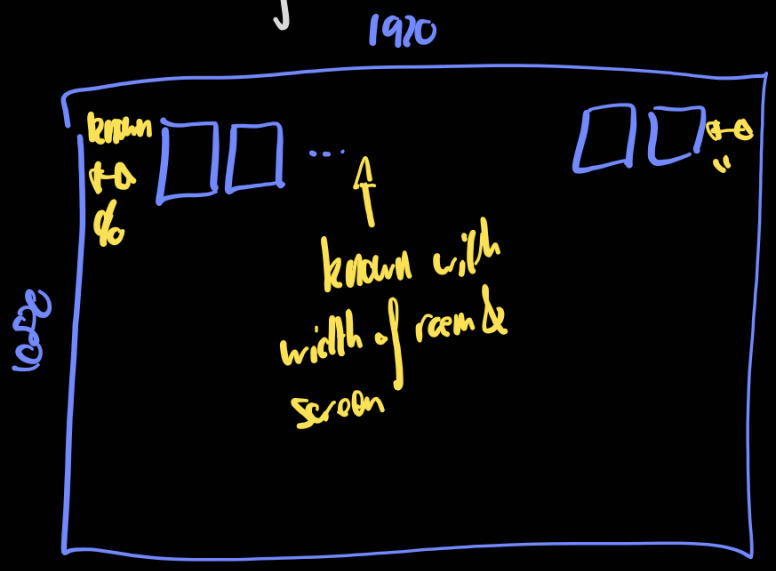
As an idea, why not:

font size = screen width // 100 → a 1920p display would give a 19 font size

That way you should always fit ~~n~~ rows ↔
n, but fixed & known

and you can determine borders with %100

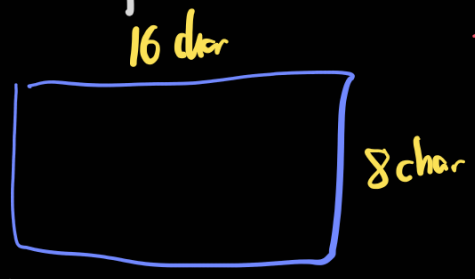
as an example



let's compute some values:

19 font size gives (12, 22) for 1 char.

rooms are currently:



if we're 1/10, why not make rooms 10x n? ...

This can of course be changed later, or simply increased by merging room tiles

So one room measures in at $16 \times 12 = 192$ px

which gives us exactly 10 rooms of length on a 1920p display!

... and that's a good reason not to...

As for height: $8 \times 22 = 176$ px which allows us to fit 6 rooms

(+) padding vertically... why not ig...

but also: $x \times 22 \times y = 1080$

room size — room number

$\Leftrightarrow x \times y = \frac{1080}{22}$ not a rational number...

$\Leftrightarrow x = \frac{1080}{22y}$

after testing out a couple of values (not willing to go below 5, or over 8...)

I think we're staying at an 8 room size vertically, allowing us to fit 6 !! at least on 16:9 displays !!

(otherwise, more padding, don't want to deal with shitty edgecases...

Okay, so what is there to implement?

① Font selection ⚠ ISSUE ⚠

based on screen size

you can't always fit 10 rooms...

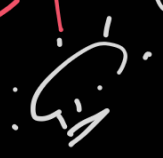
- of opl website: 3024 x 1964 res
  => font 30, w = 19, 19x16 = 304
  304 does not fit

② Padding compute based on the above:

10 rooms

6 rooms

④ ⚠ Fix: Choose font size based on fitting 10 rooms, not just screen res...



$10 \times 16 \times x \leq w$

can we make it = ?
it seems like font width increments are tiny, so... yeah?
sometimes idg.

$10 \times 16 \times x = w \iff x = \frac{w}{160}$

(and round down idg.)

for a test: $\frac{1920}{160} = 12$ → the 19 font is okay

$\frac{3024}{160} = 18.9 \to 18$
font size 29 fits,

it also gives: $3024 - 16 \times 10 \times 18 = 144$ px extra, so a 72 px padding, which is fine.

⑤ ⚠ Conclusion:
font that respects: $\frac{w}{160} \geq$ char_w.

④ if 6 rooms fit on a 16:9, they do on a 16:10 and all that go down,
① you're not playing on a phone...

② ⚠ ISSUE ⚠

what abt widescreens ??

② ⚠ fix

compute screen ratio

if wider than 16:9 → compute the other way round:

$$6 \times 8 \times y \leq h$$

$$\Leftrightarrow y \leq \frac{h}{6 \times 8}$$

$$\Leftrightarrow y \leq \frac{h}{48}$$

② ⚠ conclusion

other way round!, but do the same: adc both paddings once flat size is chosen etc...
